OWNER Founder

UPDATED 2026-08-19

[!WARNING] Retired 2026-08-19 — there is no Firebase project. The product was ported off Firebase entirely: no Hosting, no Auth, no Cloud Functions, no Firestore, no App Check, no Blaze/Spark plan. The projects this walkthrough would have created (`flygaca-firebase` , later `flygaca-app`) are deleted, and the Firebase console is not a surface anyone here uses.

What replaced it: a plain Google Cloud project — Cloud Run (the Express API), Cloud SQL for PostgreSQL (the datastore), a Cloud Storage bucket behind an HTTPS load balancer (the SPA), Secret Manager, and Cloud Scheduler — all in `me-central2` (Dammam).

Go to instead: `docs/RUNBOOK-deploy.md` in `ay2m/FLYGACA` for the real provisioning sequence, and `../hosting-facts.md` for the one-page picture of what runs where.

What is still true from this page

Only one thing, and it survived the port: **the region decision**. Personal data stays in the Kingdom, so Cloud SQL, Cloud Run and the buckets are all `me-central2` (Dammam). `me-central1` is Doha, Qatar — it is **not** in-Kingdom and must never be described as PDPL-safe.

Everything else on this page — Firestore location lock-in, Authentication, App Check, Hosting, the Blaze upgrade — describes services the product does not use.

What P0-5 now means

P0-5 in `../..//00-strategy/phase0.md` reads as "create the managed cloud project". That is still a real task; it is just a Google Cloud project rather than a Firebase one, and the sequence lives with the code. Record the resulting project ID and the confirmed region against P0-5 as before.

[!NOTE] `00-strategy/phase0.md` still narrates the Firebase-era project history (`flygaca-firebase` , `flygaca-app` , the Firestore region incident). That is a dated record of what happened and is left as written — but do not read it as current infrastructure.
