OWNER Founder

UPDATED 2026-07-03

Purpose

This document specifies how the Fly GACA health-scoring model is operationalized into a working dashboard and a runnable calculation tool. It implements the methodology defined in [docs/customer-health-scoring.md](#) and powers the proactive playbooks (at-risk, renewal, expansion).

The reference implementation is [scripts/health_score.py](#).

Data Sources & Inputs

The calculator reads a CSV where each row is one customer and each dimension is pre-scored 0–100. A sample file is provided at [scripts/sample_customers.csv](#).

Column	Type	Description
<code>customer</code>	text	Account name
<code>segment</code>	text	Flight Schools / Charter Operators / MROs / Commercial Operators
<code>plan</code>	text	Starter / Professional / Enterprise
<code>usage</code>	0–100	Product Usage dimension
<code>engagement</code>	0–100	Engagement dimension
<code>support</code>	0–100	Support Health dimension
<code>financial</code>	0–100	Financial / Contract dimension
<code>sentiment</code>	0–100	Sentiment dimension

In production these dimension scores are derived from product telemetry, the support system, the CRM, and survey data; this spec treats them as inputs.

Scoring Dimensions & Weights

The composite score is a weighted blend (weights sum to 1.0), matching `customer-health-scoring.md`:

Dimension	Column	Weight
Product Usage	usage	30%
Engagement	engagement	20%
Support Health	support	20%
Financial / Contract	financial	15%
Sentiment	sentiment	15%

```
composite = 0.30·usage + 0.20·engagement + 0.20·support + 0.15·financial + 0.15·sentiment
```

Score Bands & Triggered Playbooks

Band	Range	Recommended next step
Healthy	80–100	Expansion playbook — pursue growth / advocacy
Neutral	60–79	Renewal playbook — reinforce value, monitor
At-Risk	0–59	At-risk playbook — intervene, escalate

Output & Reporting

The tool produces, per customer: composite score, band, and the recommended playbook. It also prints a portfolio summary (account count, average score, and count per band). A `--csv` flag emits machine-readable output for ingestion into a BI dashboard.

A production dashboard should additionally visualize: score distribution by band, trend over time, accounts by segment/plan, and a drill-down to the weakest dimension per account.

How to Run the Script

```
# Human-readable table
python3 scripts/health_score.py scripts/sample_customers.csv

# Riskiest accounts first
python3 scripts/health_score.py scripts/sample_customers.csv --sort

# CSV output for BI ingestion
python3 scripts/health_score.py scripts/sample_customers.csv --csv
```

Requires Python 3 (standard library only — no installation needed).

Refresh Cadence

Health scores are recalculated **weekly** (per `customer-health-scoring.md`). Accounts scoring below 60 automatically notify the assigned CSM and enter the relevant playbook.
